The geology chapter of the Mount Shasta Companion serves as the online text for the College's *Geology of Mount Shasta* course. Like any hypertext document, it is easily updated and enables students to jump to supplemental references and glossary items with the click of a mouse.

Many of its figures are "nested" so that broad themes in one illustration can be explored in more detail in another. For example, information on dacites from Mount Shasta in the rock chart below...

... is linked to typical hand sample and thin section photographs that convey a clearer picture of what these rocks look like at different scales.

Because this document is posted online it is available to a much wider audience than any current printed version. The hypertext document can also showcase some types of media that are impossible to include in a printed text.
